

Jupiter — EKYC Onboarding

Minimum-friction account opening within fixed regulatory constraints.

Author Harshit Dev Yadav Product Jupiter (Neobank) Status Sample PRD

North-star Account-opening completion rate

TL;DR

- Product:** Jupiter – neobank account opening / EKYC flow.
- Who:** Urban users aged 18-35, mobile-first, opening a zero-balance digital savings account.
- Why now:** User research (n=10) shows 100% want a fully online process and 100% are willing to spend under 5 minutes. The current flow exceeds that threshold. Every extra step is measurable drop-off.
- Launch:** Phased rollout with a 30-day decision gate.

USER TOLERANCE THRESHOLD

CORE INSIGHT

A neobank rides a partner bank's regulated rails – you **cannot trade compliance for speed**. The problem is minimum-friction onboarding within fixed constraints, not "better UX." Every redundant OTP and repeated KYC step is drop-off that cannot be recovered through design alone.

Background & Problem

First-hand evidence: In March 2024, a Fi account access was banned because AI-powered KYC verification failed during a noisy environment. Recovery required reaching a PM directly on LinkedIn – resolved after one week. A typical user would have churned at step one of that recovery path.

Jupiter operates on Federal Bank's regulated rails. The statutory KYC requirements – PAN, Aadhaar OTP, facial verify, signature – are **fixed**. The problem is not removing steps; it's removing redundancy and perceived friction within those steps, and building a graceful recovery path when AI fails.

Competitive context: Fi and Jupiter lead on AI KYC and UX simplicity vs. HDFC, ICICI, and Kotak. Jupiter wins on positioning – but the onboarding funnel still has 30-40% drop-off before a funded account.

Goals & Non-Goals

Goals

- Consolidate redundant OTPs into one verification pass
- Pre-fill PAN + Aadhaar fields from DigiLocker retrieval (eliminate re-entry)
- Manual video KYC as a graceful fallback when AI KYC fails
- Single consolidated review screen before submit
- Instrument per-step drop-off (currently a black box)

Non-Goals

- Removing any statutory KYC step
- Changing fraud / ML check logic or reducing fraud flag rate
- Redesigning post-onboarding home or investing flows
- Building a concierge service (high effort, 3% use-case)
- Targeting non-urban or non-mobile-first segments (separate KYC path)

User Stories / JTBD

- *When I start opening an account, I want to finish in under 5 minutes so I don't abandon mid-way.*
- *When I enter my PAN, I want my details auto-filled so I don't retype what the system already knows.*
- *When KYC fails, I want a clear fallback so I'm not locked out of my own account.*
- *When I've verified everything, I want to see one clear summary so I know what I'm submitting.*

Functional Requirements

P0 – MUST SHIP

- Consolidate 3 separate OTP requests into one verification pass (phone, email, Aadhaar)
- PAN → auto-fetch name, DOB, address via DigiLocker; pre-fill form fields; user confirms, doesn't retype
- Manual video KYC fallback when AI facial recognition fails – AI failure must not mean account lock
- Single consolidated review screen before final submission

P1 – SHOULD SHIP

- Aadhaar card scan via OCR (camera-scan the number, like Amazon does for credit cards)
- Per-step drop-off analytics (step name, exit rate, device/OS breakdown)
- Smart retry with context: "Your Aadhaar OTP expired – tap to resend" (not a generic error)

P2 - NICE TO HAVE

- Truecaller SDK for phone number pre-fill
- Progress bar + step count to reduce perceived friction
- Resume-where-you-left-off for sessions abandoned mid-flow

Acceptance Criteria

REQUIREMENT	PASS / FAIL TEST
OTP consolidation User receives at most 2 OTPs total (phone + Aadhaar); email verify happens silently post-submission	≤2 OTPS PER SESSION
Pre-fill PAN entry triggers DigiLocker auto-fetch; name/DOB appear within 2s; user edits are respected	FIELDS POPULATED, NO RETYPE REQUIRED
AI KYC fallback When facial recognition fails, video KYC offered within same session – no forced restart	ZERO FORCED RESTARTS ON AI FAILURE
Review screen Every submitted field visible on one screen before final CTA	USER CAN AUDIT ALL DATA BEFORE SUBMIT

Success Metrics

★ NORTH-STAR METRIC

Account-opening completion rate (start → funded account)

Baseline ~60% → Target ~75% in 90 days (+15pp)

Guardrails (must not worsen):

KYC pass integrity / fraud-flag rate · Manual video KYC usage rate (rising = AI model degradation) · Per-step drop-off · Regulatory step omission rate (zero)

Wireframes / User Flows

FLOW 1 - OTP CONSOLIDATION + PAN PRE-FILL

Phone entry → [DigiLocker fetch triggered] → fields pre-filled → user confirms → single OTP screen (phone + Aadhaar) → verified ✓ → proceed

Facial verify step → [AI attempt] → success: proceed → failure: "Verification didn't work – try video KYC instead" → video KYC slot booked → proceed

All P0 steps complete → Review (name, DOB, PAN, Aadhaar last 4, address, photo) → Submit

Risks & Open Questions

- KNOWN** **Aadhaar OTP + phone OTP simultaneous:** UIDAI does not allow a single OTP to satisfy both. "One OTP" is the phone OTP; Aadhaar remains separate. The win is UX sequencing and fewer screens, not one OTP total.
- KNOWN** **Name mismatch (PAN vs. Aadhaar):** Common for married name changes and transliteration differences. Flag mismatch, let user proceed with a note – do not hard-block.
- OPEN** **DigiLocker integration scope:** Does Jupiter / Federal Bank already have a DigiLocker agreement? If not, this is a compliance procurement task, not just engineering – must confirm before P0 timeline commitment.
- OPEN** **Current AI KYC failure rate:** Without this baseline, we cannot set a meaningful target for fallback usage. Confirm with data eng before sprint planning.

Rollout Plan

- PHASE 1** **Days 0-30 • 10% of new sign-ups**
Instrument drop-off per step. Decision gate: if completion rate improves ≥8pp and fraud-flag rate is flat, proceed. If guardrails breach, rollback immediately.
- PHASE 2** **Days 31-60 • 50% rollout**
Activate Aadhaar OCR scan (P1). A/B test consolidated OTP copy vs. control.
- PHASE 3** **Days 61-90 • 100% rollout**
Evaluate P2 items (Truecaller, progress bar). Instrument video KYC fallback rate for ML team review.
